

SAP BusinessObjects Data Integrator XI 3.0/3.1: Core Concepts – BOI300

IN BRIEF

Delivery: Instructor-led course

Duration: Three days

Cost: \$2,400 per person + GST

Inclusions: SAP BusinessObjects expert instructor, comprehensive course manual, individual computer access, and fully catered lunch, morning and afternoon tea breaks.

Prerequisites: To be successful, learners who attend this course should have experience with the following:

- Knowledge of data warehousing and ETL concepts
- Experience with MySQL and SQL language
- Experience using functions, elementary procedural programming, and flow-of-control statements such as If-Then-Else and While Loop
- statements

Products Covered:

SAP BusinessObjects Data Integrator

Previous Training:

None

Course Description

This three day instructor led enables you to integrate disparate data sources to deliver more timely and accurate data that end users in an organization can trust.

You will learn about creating, executing, and troubleshooting batch jobs, using functions, scripts and transforms to change the structure and formatting of data, handling errors, and capturing changes in data.

As a business benefit, by being able to create efficient data integration projects, you can use the transformed data to help improve operational and supply chain efficiencies, enhance customer relationships, create new revenue opportunities, and optimize return on investment from enterprise applications.

Audience

This course is designed for individuals responsible for implementing, administering, and managing data integration projects.

Topics Covered

Describing Data Services

- Describe the purpose of Data Services
- Describe Data Services architecture
- Define Data Services objects
- Use the Data Services Designer interface

Defining Source and Target Metadata

- Use datastores
- Use datastore and system configurations
- Define file formats for flat files
- Define file formats for Excel files
- Define file formats for XML files

Creating Batch Jobs

- Work with objects
- Create a data flow
- Use the Query transform
- Use target tables
- Execute the job

Troubleshooting Batch Jobs

- Use descriptions and annotations
- Validate and tracing jobs
- Use View Data and the Interactive Debugger
- Use auditing in data flows

Using Functions, Scripts, and Variables

- Define built-in functions
- Use functions in expressions
- Use the lookup function
- Use the decode function
- Use variables and parameters
- Use Data Services scripting language
- Script a custom function

Using Platform Transforms

- Describe platform transforms
- Use the Map Operation transform
- Use the Validation transform
- Use the Merge transform
- Use the Case transform
- Use the SQL transform

Setting up Error Handling

- Set up recoverable work flows
- Capturing Changes in Data
- Update data over time
- Use source-based CDC
- Use target-based CDC

Using Data Integrator Transforms

- Describe the Data Integrator transforms
- Use the Pivot transform
- Use the Hierarchy Flattening transform
- Describe performance optimization
- Use the Data Transfer transform
- Use the XML Pipeline transform
